

ABSTRACT OF THE DISCLOSURE

5 A chisel device for providing a chisel and slide hammer
combination. The chisel device includes an elongated body having
a first end and a second end. An annular flange is integrally
coupled to and extends around the elongated body. The flange is
positioned generally between the first and second ends of the
10 elongated body. The second end comprises a female coupler. A
tubular member has an aperture extending therethrough. The
elongated body extends through the aperture such that the tubular
member is slidably positioned between the flange and the first end
of the elongated body such that the tubular member defines a slide
15 hammer. At least one head has a bit portion and a male coupler
portion located opposite of each other. The male coupler is adapted
for releasably securing to the female coupler.
